

PST27X 320W

DC-DC Conduction cooled

Input ranges : 9-50Vdc, 18-36Vdc, 16-50Vdc

1 output 3V3 to 48Vdc, 320W max.

80*190*21mm

Automatic reverse polarity, surge and transient protected

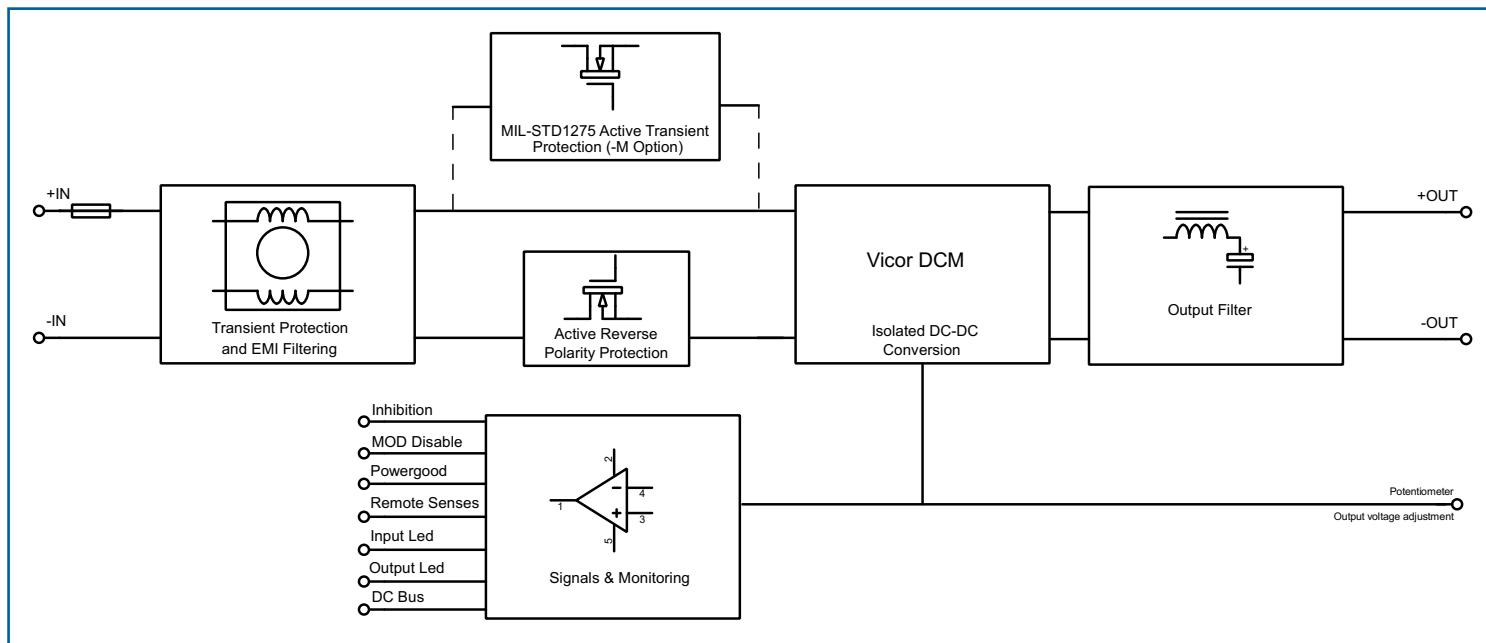

-40°C to 90°C baseplate

MV Option for MIL-STD 1275 and Severe environments

Safety IEC/EN 62368-1, RoHS lead-free-solder compliant

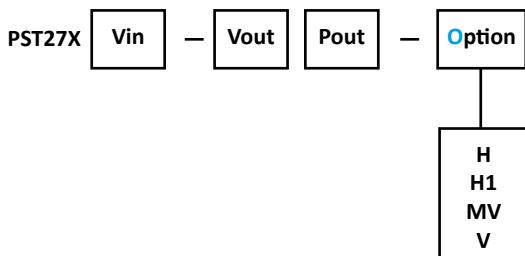

The PST27X, Very low profile DC-DC converter incorporates input filtering, very robust mechanical, conformal coating, required in most of the severe environments. The converter provides high reliability thanks to the integration of Vicor Corp. modules, high efficiency, input-to-output isolation, soft start, input over/undervoltage lockout. The converter is protected against input reverse polarity, surges and transients, EMI filtered built to meet MIL-STD 461, MIL-STD 810, MIL-STD 704 and MIL-STD 1275. The output is continuously short-circuit proof.

Configurations

For Input and Output configurations see page 2 and 3.

H : Heatsink longitudinal fins

H1 : Heatsink transversal fins

MV : Ruggedized & Conformal coating

V : Conformal coating

Input Transient Protection

A Transil diode and a common mode input filter form an effective protection against input fast transients in severe environments like railways.

The unit incorporates an active protection circuit against high energy transient MIL STD 1275, DO160.

Input Fuse

A fuse mounted inside the converter protects against damages in case of a failure. The fuse is not user-accessible.

Input Reverse Polarity

An active Mosfet circuit placed internally at the input will block the current in case of reversed polarity, no damage to the unit and unit will come back to normal operation when resumed.

Input Inrush Current

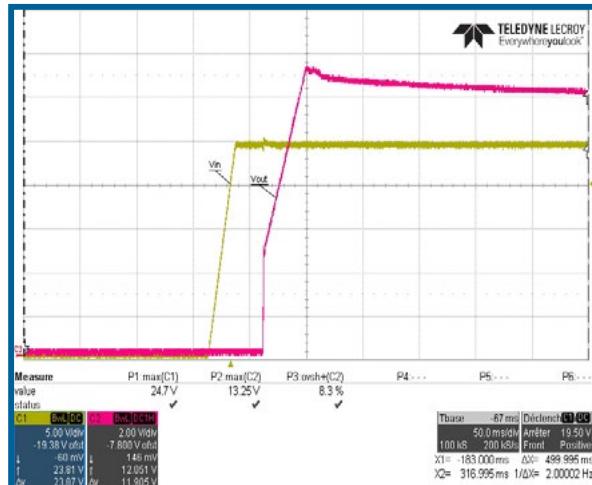

They are no inrush limitation other than input serial choke from EMI filter and these included into the Vicor DCM converter as the input capacitors are quite limited. See above table for the values.

Input UVP/ OVP

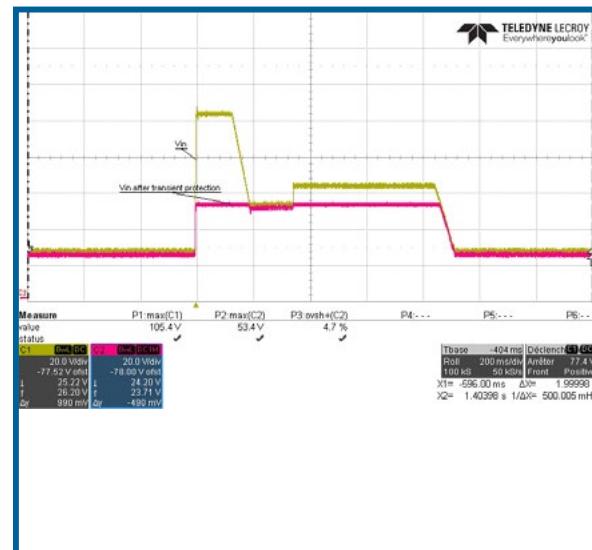

The PST27X includes input undervoltage protection (UVP) and overvoltage protection (OVP) which will stop the converter in the event of an under/oversupply and restart when input comes back in its normal range. See table above for the value according input range. Do not exceed absolute maximum rating in any case.

Output Current Limitation

See Electrical output data for current limitation value according part-number.

The converter output is continuously protected against short-circuit or current limitation by disabling the power train when output current goes above the value from the table page 3. When the default disappear, the converter will go back to normal operation after initialization.

Output OVP

The PST27X includes output overvoltage protection (OVP) which will stop the converter in the event of an overvoltage and restart when input comes back in its normal range. See table above for the value according output voltages. Nevertheless exceeding these values may damage the converter.

Parallel and Series Connection

A converter output can be connected in series with an output from a separate converter, a diode across each output may be implemented externally (Cathode to +OUT) to provide continuity in case of one failure. The maximum output current of a serial-connected outputs is limited by the output with the lowest current limit. Output voltages above 48V (SELV - Safety Extra Low Voltage) require additional safety measures in order to comply with international safety requirements.

Parallel operation is possible to increase output power.

In standard, the unit is delivered in standalone configuration for single converter use : Switch SW2 in position P2.

To Parallelize multiple converters, set the switch SW2 in position P1. The output voltage of each unit must be set separately at the same value, thanks to the P1 potentiometer, with no load at the output, before parallelizing to ensure proper current sharing between the units.

Hold-up time

The converter provides limited hold-up time. If a hold-up time is required (some railways applications for example), use external input capacitors of adequate size.

Formula for additional external input capacitor : $C = 2 * P_{out} * t_h * 100 / (V^2 - V_i^2) / n$

whereas :

C = external input capacitance [mF]
 P_{out} = output power [W]
 n = efficiency [%]
 t_h = hold-up time [ms]
 V_i = minimum input voltage
 V = Input voltage level before interruption

Thermal Considerations

The converter is designed to be mounted on a dissipative area, in conduction cooling mode. The max. operating temperature is the temperature of the baseplate which should not exceed 90°C.

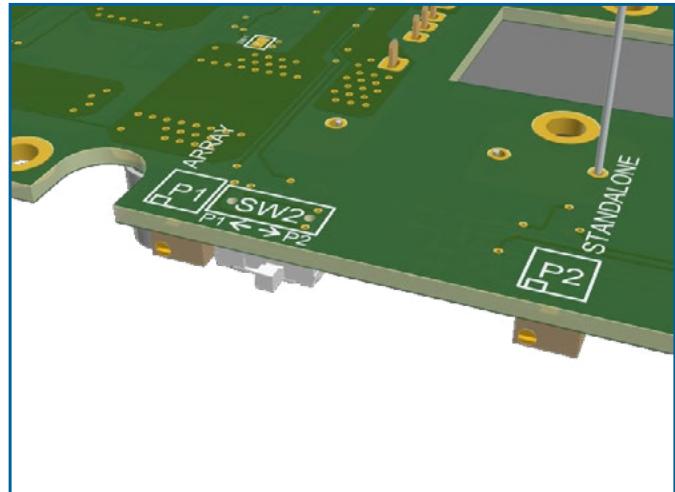

Addition of grease or thermal pad between the converter baseplate and the chassis is mandatory. When used with heatsink in conduction cooled or air forced, the thermal impedance R_{th} ($^{\circ}\text{C}/\text{W}$) of the heatsink should be calculated taking into account max baseplate temp. 90°C (Tb max.), max operating ambient (Ta max.), dissipated power (Pdiss). $R_{th} = (Tb \text{ max.} - Ta \text{ max.}) / P_{diss}$.

$$R_{th} = (Tb \text{ max.} - Ta \text{ max.}) / P_{diss}$$

As an example, see R_{th} of H and H1 heatsink option in the option description paragraph and graph of power derating .

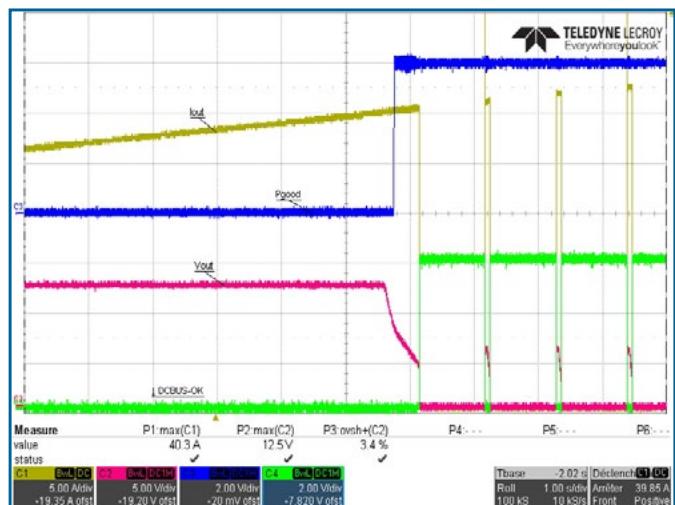

Thermal protection

A temperature protection is integrated in each Vicor module, disabling output when heatsink temperature exceeds 105°C. The converter automatically restarts, when the temperature drops below this limit. Nevertheless, exceeding the max operating temperature may cause failures of the converter.

Auxiliary Functions

MOD Disable / Inhibit (Remote On/Off)

The inhibit input pin enables the converter when logic low or left opened circuit between MOD Disable and MOD Disable RTN. The converter will be disabled when logic high 3.3V-15V between MOD Disable and MOD Disable RTN.

This signal is referenced to the input voltage and will disable the output at the same time when the same signal is used for several converters. In systems consisting of several converters, this feature may be used to sequence the activation of the different converters if inhibition is used separately.

You can also use a potential free contact by connecting INH to SE-.

Output Voltage Adjustment

The converter output voltage can be adjustable by potentiometer, placed at the output side, between -20% to +10% of the nominal voltage (see page 3).

Adjust potentiometer P1 when used as a single converter and potentiometer P2 when multiple converters are used in parallel.

Sense Lines

This feature enables compensation of voltage drop across the connector contacts and the load lines by connecting +S and -S at the load location.

The overall voltage compensation in the + and - power lines should not exceed +10% of the nominal output voltage as it may.

Powergood

An open collector PGood signal (PGD, PGD RTN) is opened when output fails and closed when unit operates properly with output voltages in its normal range. Do not exceed 30Vdc/20mA.

DC Bus

DC Bus reflects the converter status. An open collector is closed when converter is OK and opened when Fault (input under or over voltage, over current, etc..)

Input / Output Led

Two green leds status indicate the presence of corresponding input (LED IN OK) and output (LED OUT OK) voltages.

Options Description

Heatsink (-H or -H1)

The PST27X is built as standard with an aluminum baseplate as described in the mechanical data. The converter can be delivered with a 15mm height heatsink with longitudinal fins (-H) or transversal fins (-H1). See mechanical drawings. 3D models available on the web site.

In case of using H or H1 option, the thermal impedance (Rth) of the heatsink mentioned below must be considered for the airflow or maximum power calculation. Conditions : 55°C ambient, convection (0m/s vertical mounting) and 2m/s airflow:

PST27X -H : Rth@0m/s: 2.2°C/W, Rth@2m/s: 1°C/W

PST27X -H1: Rth@0m/s: 2.2°C/W, Rth@2m/s: 1°C/W

Ruggedized (-MV)

The PST27X can be ruggedized to meet MIL-STD810E, MIL-STD461E CE102.

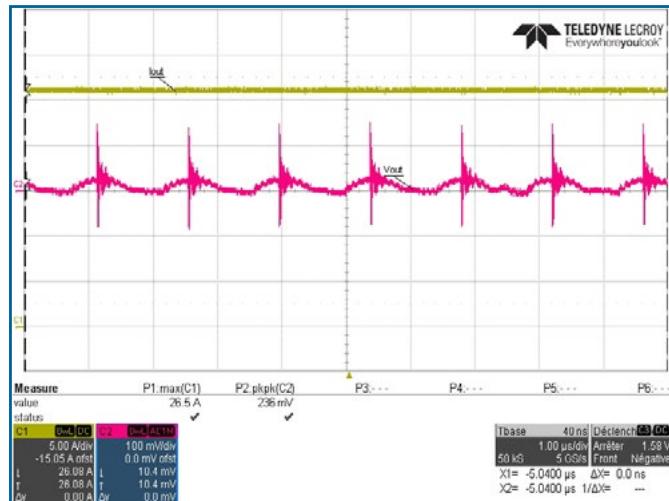

MV option is available for 12 & 28Vin only and will comply with MIL STD 1275A. When -M is selected , the -V has to be selected as well.

Conformal coating (-V)

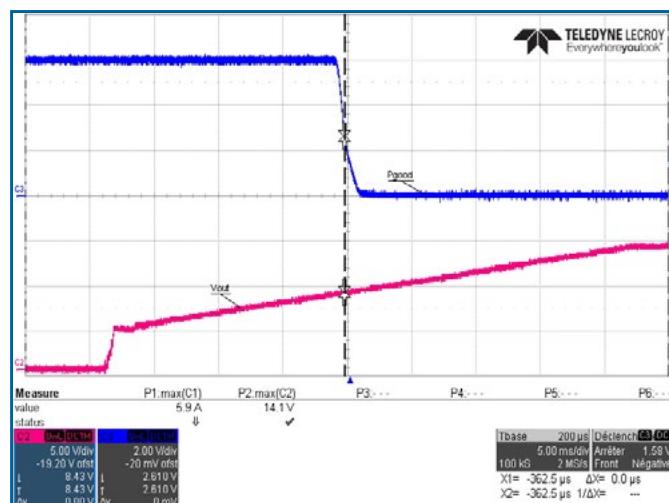

During manufacturing process, when V option is specified, components and pcb are covered with an acrylic coating to address high level of ambient with humidity application.
